

Attendance:

Margaret Kreutz, Nick Potter, Jarrett Nelson, Katie Hancock

UI is mostly functional now. There is a bug with the output

Tkinter themes may be how we change the color scheme of our application.

Objectives:

~~Fix issues with output errors when reading (Margo)~~

Write a function that is bound to some action to change the color scheme

Write in all of the different colors of the different themes (possibly as ENUMs`)

On clicking the switch between default and custom colors: reread the configuration document (containing the colors). Then the application will restart with the custom colors. (Katie)

Colors should be variables with their default as the UVU colors

If there is information in the configuration file, parse the data, error check this, then pass these values into the color variables,

Add copy, paste, and edit functionalities to the input files. (Nick)

On double click on a line, it allows you to edit the selected line

Add error checking to input file after being edited (Jarrett)

Add a new button to change the file (this will update the file path and restart the application) (Jarrett)

Add documentation / prep deliverables (Margo)
